

TERCER PARCIAL
19 de noviembre de 2020

Indicaciones generales

- Este es un examen **individual** con una duración de **120 minutos: de 9:00 a 11:00 a.m.**.
- Sólo se permite el uso de calculadoras como medio electrónico. Los celulares deben estar apagados durante todo el examen.
- Las cámaras deben estar activas durante todo el examen.
- Puede usar una única hoja con apuntes. El uso de libros u otro recurso “analógico” diferente no está permitido.
- Cualquier incumplimiento de lo anterior conlleva a la anulación del examen.
- Las respuestas deben estar totalmente justificadas.
- Al finalizar, suba a eaulas un **único** archivo .pdf con su solución. En caso de problemas con la plataforma envíe su archivo por el chat privado de Teams a martin.andrade@urosario.edu.co.
- ¡Suerte y ánimo!

1. (20 pts) Recientemente se han probado dos tipos diferentes de aislamiento de cables eléctricos para determinar el nivel de voltaje al que tienden a ocurrir las fallas. Los resultados de un experimento de laboratorio indican que ocurrieron fallas al someter los aislamientos a los siguientes voltajes:

| Tipo A | | Tipo B | |
|--------|----|--------|----|
| 36 | 54 | 52 | 60 |
| 44 | 52 | 64 | 44 |
| 41 | 37 | 38 | 48 |
| 53 | 51 | 68 | 46 |
| 38 | 44 | 66 | 70 |
| 36 | 35 | 52 | 62 |
| 34 | 44 | | |

- a) Suponga que se sabe que los voltajes a los que ocurren fallas con el aislamiento de tipo A se distribuyen normalmente con una media desconocida μ_1 y una varianza conocida $\sigma_1^2 = 40$, mientras que la distribución correspondiente para el aislamiento de tipo B es normal con media desconocida μ_2 y varianza conocida $\sigma_2^2 = 100$. Determine un intervalo de confianza con coeficiente de confianza 0.95 para $\mu_1 - \mu_2$.
- b) Suponga ahora que no se conocen las varianzas poblacionales (se puede asumir que son iguales). Determine un intervalo de confianza con coeficiente de confianza 0.95 para $\mu_1 - \mu_2$ (pista: Use T como cantidad pivote).
2. (15 pts)
- a) ¿En el punto 1A, hay evidencia suficiente para contradecir que la diferencia de las medias ($\mu_1 - \mu_2$) sea igual a -5 ? Utilice $\alpha = 0.05$. Determine el valor p .

- b) ¿En el punto 1B hay evidencia suficiente para contradecir que la diferencia de las medias $(\mu_1 - \mu_2)$ sea mayor o igual a -5 ? Utilice $\alpha = 0.01$.
3. (15 pts) Sean X_1, \dots, X_n v.a's aleatorias iid con distribución uniforme continua en $(0, \theta)$, $\theta > 0$. Considere el siguiente estimador de θ :

$$\hat{\theta} = \max\{X_1, \dots, X_n\}.$$

- a) Verifique si $\hat{\theta}$ es insesgado
- b) Defina una función de $\hat{\theta}$ que resulte en un estimador insesgado.

Table A.3 (continued) Areas under the Normal Curve

Table of the Student's t -distribution

The table gives the values of $t_{\alpha;v}$ where
 $\Pr(T_v > t_{\alpha;v}) = \alpha$, with v degrees of freedom

| α | 0.1 | 0.05 | 0.025 | 0.01 | 0.005 | 0.001 | 0.0005 |
|----------|-------|-------|--------|--------|--------|---------|---------|
